METHOD OF INHIBITING AMYLOID PROTEIN AGGREGATION AND
IMAGING AMYLOID DEPOSITS USING ISOINDOLINE DERIVATIVES

FIELD OF THE INVENTION

This invention relates to a method of inhibiting amyloid protein
5 aggregation and imaging amyloid deposits. More particularly, this invention
relates to a method of inhibiting amyloid protein aggregation in order to treat
Alzheimer's disease using isoindoline derivatives.

BACKGROUND OF THE INVENTION

Amyloidosis is a condition characterized by the accumulation of various
10 insoluble, fibrillar proteins in the tissues of a patient. The fibrillar proteins that
comprise the accumulations or deposits are called amyloid proteins. While the
particular proteins or peptides found in the deposits vary, the presence of fibrillar
morphology and a large amount of β -sheet secondary structure is common to
many types of amyloids. An amyloid deposit is formed by the aggregation of
15 amyloid proteins, followed by the further combination of aggregates and/or
amyloid proteins.

The presence of amyloid deposits has been shown in various diseases,
each with its particular associated protein, such as Mediterranean fever, Muckle-
Wells syndrome, idiopathic myeloma, amyloid polyneuropathy, amyloid
20 cardiomyopathy, systemic senile amyloidosis, amyloid polyneuropathy,
hereditary cerebral hemorrhage with amyloidosis, Alzheimer's disease, Down's
syndrome, Scrapie, Creutzfeldt-Jacob disease, Kuru, Gerstmann-Straussler-
Scheinker syndrome, medullary carcinoma of the thyroid, isolated atrial amyloid,
 β_2 -microglobulin amyloid in dialysis patients, inclusion body myositis,
25 β_2 -amyloid deposits in muscle wasting disease, sickle cell anemia, Parkinson's
disease, and Islets of Langerhans diabetes Type II insulinoma.

-2-

Alzheimer's disease is a degenerative brain disorder characterized clinically by progressive loss of memory, cognition, reasoning, judgement, and emotional stability that gradually leads to mental deterioration and ultimately death. Because Alzheimer's disease and related degenerative brain disorders are a major medical issue for an increasingly aging population, the need for new treatments and methods for diagnosing the disorders are needed.

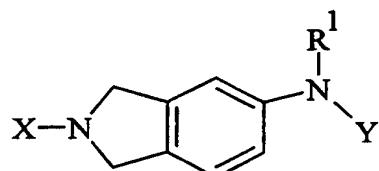

A simple, noninvasive method for detecting and quantitating amyloid deposits in a patient has been eagerly sought. Presently, detection of amyloid deposits involves histological analysis of biopsy or autopsy materials. Both methods have major drawbacks. For example, an autopsy can only be used for a postmortem diagnosis.

The direct imaging of amyloid deposits *in vivo* is difficult, as the deposits have many of the same physical properties (ie, density and water content) as normal tissues. Attempts to image amyloid deposits directly using magnetic resonance imaging (MRI) and computer-assisted tomography (CAT) have been disappointing and have detected amyloid deposits only under certain favorable conditions. In addition, efforts to label amyloid deposits with antibodies, serum amyloid P protein, or other probe molecules has provided some selectivity on the periphery of tissues, but has provided for poor imaging of tissue interiors.

Thus, it would be useful to have a noninvasive technique for imaging and quantitating amyloid deposits in a patient. In addition, it would be useful to have compounds that inhibit the aggregation of amyloid proteins to form amyloid deposits.

SUMMARY OF THE INVENTION

The present invention provides compounds having the Formula I:

I

or the pharmaceutically acceptable salts thereof,

-3-

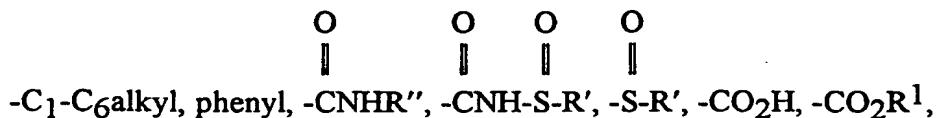

wherein

X is phenyl or substituted phenyl;

Y is phenyl, substituted phenyl, pyridyl, or substituted pyridyl;

wherein substituted phenyl and substituted pyridyl can have from 1 to

5 4 substituents, each independently selected from -OC₁-C₁₂alkyl, halogen,

10 -NO₂, -CF₃, -CN, -NR¹R², -(CH₂)_nCO₂H, -(CH₂)_nCO₂R¹,
 -SO₂NR¹R², tetrazole, -(CH₂)_n-tetrazole, decahydroisoquinoline,
 imidazole, -(CH₂)_n imidazole, -CH=CH-tetrazole, -CH=CH-imidazole, or
 phenyl;

15 R¹ and R² independently are hydrogen or C₁-C₆alkyl;
 each n is independently 0 to 5 inclusive;
 R'' is hydrogen, C₁-C₆alkyl, or phenyl; and
 R' is hydrogen, C₁-C₆alkyl, -CF₃, or phenyl.

20 In a preferred embodiment of the compounds of Formula I, X is
 substituted phenyl and the substituted phenyl has from 1 to 3 substituents
 independently selected from -OC₁-C₆alkyl, halogen, C₁-C₆alkyl, -CF₃, or
 phenyl.

25 In a preferred embodiment of the compounds of Formula I,
 Y is substituted phenyl and the substituted phenyl has from 1 to 3 substituents
 independently selected from -CO₂H, -NO₂, -OC₁-C₁₂ alkyl, -CN, tetrazole,
 -(CH₂)_nCO₂H, -SO₂NR¹R², -CF₃, imidazole, -(CH₂)_n-tetrazole,
 -(CH₂)_n imidazole, -CH=CH-tetrazole, or -CH=CH-imidazole.

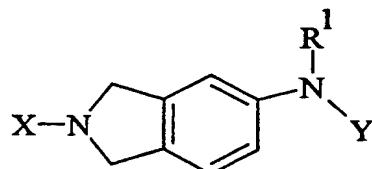

30 In a preferred embodiment of the compounds of Formula I,
 Y is substituted phenyl and the substituted phenyl has from 1 to 3 substituents,
 one of which is selected from -CO₂H.

-4-

In a more preferred embodiment of the compounds of Formula I, Y is substituted phenyl, wherein the substituent is $\text{-CO}_2\text{H}$, which is located at the 2 position of the phenyl ring.

5 In a more preferred embodiment of the compounds of Formula I wherein X is substituted phenyl, the substituted phenyl has two chlorine substituents located at the 3 and 4 positions of the phenyl ring.

Also provided by the present invention are compounds having the Formula I:

I

10 or the pharmaceutically acceptable salts thereof,
wherein

X is phenyl or substituted phenyl,

wherein when X is substituted phenyl, the substituted phenyl has from 1 to 4 substituents independently selected from $\text{-OC}_1\text{-C}_6\text{alkyl}$, halogen,

15 $\text{C}_1\text{-C}_6\text{alkyl}$, -CF_3 , or phenyl;

Y is phenyl, substituted phenyl, pyridyl, or substituted pyridyl;

wherein when Y is substituted phenyl or substituted pyridyl, the substituted

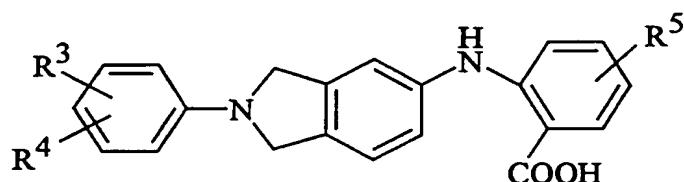

phenyl or substituted pyridyl has from 1 to 4 substituents independently selected from $\text{-CO}_2\text{H}$, -NO_2 , $\text{-OC}_1\text{-C}_{12}\text{alkyl}$, -CN , -CF_3 , $\text{-(CH}_2\text{)}_n\text{CO}_2\text{H}$,

20 $\text{-SO}_2\text{NR}^1\text{R}^2$, tetrazole, $\text{-(CH}_2\text{)}_n\text{-tetrazole}$, decahydroisoquinoline, phenyl, imidazole, $\text{-(CH}_2\text{)}_n$ imidazole, -CH=CH-tetrazole , or -CH=CH-imidazole ;

R^1 and R^2 independently are hydrogen or $\text{C}_1\text{-C}_6\text{alkyl}$; and

each n is independently 0 to 5 inclusive.

Especially preferred compounds have Formula II

II

-5-

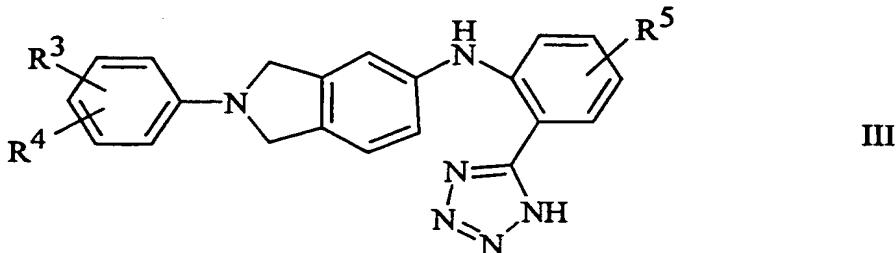

and pharmaceutically acceptable salts thereof,
wherein

R^3 is halo;

R^4 is hydrogen or halo; and

5 R^5 is hydrogen, halo, C_1-C_6 alkyl, $-O-C_1-C_6$ alkyl, $-CF_3$, $-NO_2$, or $-NR^1R^2$.

Another preferred group of invention compounds have Formula III

and pharmaceutically acceptable salts thereof,
wherein

10 R^3 is halo;

R^4 is hydrogen or halo; and

R^5 is hydrogen, halo, C_1-C_6 alkyl, $-O-C_1-C_6$ alkyl, $-CF_3$, $-NO_2$, or $-NR^1R^2$.

Also provided are the compounds:

2-[2-(2,3,4-Trimethoxy-phenyl)-2,3-dihydro-1H-isoindol-5-ylamino]-

15 Also provided is a pharmaceutical composition comprising a compound of Formula I together with a pharmaceutically acceptable carrier, diluent, or excipient therefor.

Also provided is a method of treating Alzheimer's disease, the method comprising administering to a patient having Alzheimer's disease a therapeutically effective amount of a compound of Formula I.

20 Also provided is a method of inhibiting the aggregation of amyloid proteins to form amyloid deposits, the method comprising administering to a patient in need of inhibition of the aggregation of amyloid proteins an amyloid protein aggregation inhibiting amount of a compound of Formula I.

25 Also provided is a method of imaging amyloid deposits, the method comprising the steps of:

a. introducing into a patient a detectable quantity of a labeled compound of Formula I

I

30 or a pharmaceutically acceptable salts thereof,

wherein

X is phenyl or substituted phenyl;

Y is phenyl or substituted phenyl;

wherein substituted phenyl can have from 1 to 5 substituents, each independently

5 selected from -OC₁-C₁₂alkyl, halogen, C₁-C₆alkyl, phenyl,

-CNH R'' , -CNH-S-R', -S-R', -CO₂H, -CO₂R¹, -NO₂, -CF₃, -CN,

10

-NR¹R¹, -(CH₂)_nCO₂H, -(CH₂)_nCO₂R¹, -SO₂NR¹R¹, tetrazole,

$-(CH_2)_n$ -tetrazole, imidazole, $-(CH_2)_n$ imidazole, $-CH=CH$ -tetrazole, or

-CH=CH-imidazole:

each R¹ is independently hydrogen or C₁-C₆alkyl;

15

each n is independently 0 to 5 inclusive;

R'' is hydrogen, C₁-C₆alkyl, or phenyl; and

R' is hydrogen, C₁-C₆alkyl, -CF₃, or phenyl.

b. allowing sufficient time for the labeled compound to become associated with amyloid deposits; and

- c. detecting the labeled compound associated with the amyloid deposits.

In a preferred embodiment of the method, the patient has or is suspected to have Alzheimer's disease.

In a preferred embodiment of the method, the labeled compound is a radiolabeled compound.

In a preferred embodiment of the method, the labeled compound is detected using MRI.

DETAILED DESCRIPTION OF THE INVENTION

The term "alkyl" means a straight or branched chain hydrocarbon.

Representative examples of alkyl groups are methyl, ethyl, propyl, isopropyl, isobutyl, butyl, tert-butyl, sec-butyl, pentyl, and hexyl.

5 Preferred alkyl groups are C₁-C₆ alkyl.

The term "alkoxy" means an alkyl group attached to an oxygen atom.

Representative examples of alkoxy groups include methoxy, ethoxy, tert-butoxy, propoxy, and isobutoxy.

The term "halogen" includes chlorine, fluorine, bromine, and iodine.

10 The term "substituted" means that one or more hydrogen atom in a molecule has been replaced with another atom or group of atoms. For example, substituents include halogen, -OH, -CF₃, -NO₂, -NH₂, -NH(C₁-C₆alkyl), -N(C₁-C₆alkyl)₂, C₁-C₆ alkyl, -OC₁-C₆ alkyl, -CN, -CF₃, -CO₂H, and -CO₂C₁-C₆ alkyl.

15 The term "substituted phenyl" means a phenyl ring in which from 1 to 4 hydrogen atoms have been independently replaced with a substituent, preferably one selected from the list above. Examples include 3-chlorophenyl, 2,6-dibromophenyl, 4-nitrophenyl, 3,4,5-trimethoxyphenyl, and 3-diethylaminophenyl.

20 The symbol “-“ means a covalent bond.

25 The term "pharmaceutically acceptable salt, ester, amide, and prodrug" as used herein refers to those carboxylate salts, amino acid addition salts, esters, amides, and prodrugs of the compounds of the present invention which are, within the scope of sound medical judgement, suitable for use in contact with the tissues of patients without undue toxicity, irritation, allergic response, and the like, commensurate with a reasonable benefit/risk ratio, and effective for their intended use, as well as the zwitterionic forms, where possible, of the compounds of the invention. The term "salts" refers to the relatively nontoxic, inorganic and organic acid addition salts of compounds of the present invention. These salts can be prepared in situ during the final isolation and purification of the compounds or by separately reacting the purified compound in its free base form with a suitable

-11-

organic or inorganic acid and isolating the salt thus formed. Representative salts include the hydrobromide, hydrochloride, sulfate, bisulfate, nitrate, acetate, oxalate, valerate, oleate, palmitate, stearate, laurate, borate, benzoate, lactate, phosphate, tosylate, citrate, maleate, fumarate, succinate, tartrate, naphthylate 5 mesylate, glucoheptonate, lactobionate and laurylsulphonate salts, and the like. These may include cations based on the alkali and alkaline earth metals, such as sodium, lithium, potassium, calcium, magnesium, and the like, as well as, nontoxic ammonium, quaternary ammonium and amine cations including, but not limited to ammonium, tetramethylammonium, tetraethylammonium, methylamine, 10 dimethylamine, trimethylamine, triethylamine, ethylamine, and the like. (See, for example, Berge S.M., et al., *Pharmaceutical Salts, J. Pharm. Sci.*, 66:1-19 (1977) which is incorporated herein by reference.)

Examples of pharmaceutically acceptable, nontoxic esters of the compounds of this invention include C₁-C₆ alkyl esters wherein the alkyl group is a straight or branched chain. Acceptable esters also include C₅-C₇ cycloalkyl esters as well as arylalkyl esters such as, but not limited to benzyl. C₁-C₄ alkyl 15 esters are preferred. Esters of the compounds of the present invention may be prepared according to conventional methods.

Examples of pharmaceutically acceptable, nontoxic amides of the compounds of this invention include amides derived from ammonia, primary C₁-C₆ alkyl amines and secondary C₁-C₆ dialkyl amines wherein the alkyl groups are straight or branched chain. In the case of secondary amines, the amine may also be in the form of a 5- or 6-membered heterocycle containing one nitrogen atom. Amides derived from ammonia, C₁-C₃ alkyl primary amides and 20 C₁-C₂ dialkyl secondary amides are preferred. Amides of the compounds of the invention may be prepared according to conventional methods.

The term "prodrug" refers to compounds that are rapidly transformed in vivo to yield the parent compound of the above formulas, for example, by hydrolysis in blood. A thorough discussion is provided in T. Higuchi and 25 V. Stella, Pro-drugs as Novel Delivery Systems, Vol. 14 of the A.C.S. Symposium Series, and in Bioreversible Carriers in Drug Design, ed. Edward B. Roche,

-12-

American Pharmaceutical Association and Pergamon Press, 1987, both of which are incorporated herein by reference.

5 In addition, the compounds of the present invention can exist in unsolvated as well as solvated forms with pharmaceutically acceptable solvents such as water, ethanol, and the like. In general, the solvated forms are considered equivalent to the unsolvated forms for the purposes of the present invention.

10 The compounds of the present invention can exist in different stereoisometric forms by virtue of the presence of asymmetric centers in the compounds. It is contemplated that all stereoisometric forms of the compounds, as well as mixture thereof, including racemic mixtures, form part of this invention.

In the first step of the present method of imaging, a labeled compound of Formula I is introduced into a tissue or a patient in a detectable quantity. The compound is typically part of a pharmaceutical composition and is administered to the tissue or the patient by methods well-known to those skilled in the art.

15 In the methods of the present invention, a compound can be administered either orally, rectally, parenterally (intravenous, by intramuscularly or subcutaneously), intracisternally, intravaginally, intraperitoneally, intravesically, locally (powders, ointments or drops), or as a buccal or nasal spray.

20 Compositions suitable for parenteral injection may comprise physiologically acceptable sterile aqueous or nonaqueous solutions, dispersions, suspensions or emulsions, and sterile powders for reconstitution into sterile injectable solutions or dispersions. Examples of suitable aqueous and nonaqueous carriers, diluents, solvents, or vehicles include water, ethanol, polyols (propyleneglycol, polyethyleneglycol, glycerol, and the like), suitable mixtures thereof, vegetable oils (such as olive oil), and injectable organic esters such as ethyl oleate. Proper fluidity can be maintained, for example, by the use of a coating such as lecithin, by the maintenance of the required particle size in the case of dispersions and by the use of surfactants.

25

30 These compositions may also contain adjuvants such as preserving, wetting, emulsifying, and dispensing agents. Prevention of the action of microorganisms can be ensured by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, sorbic acid, and the like. It may also be desirable to include isotonic agents, for example sugars, sodium chloride, and the

-13-

like. Prolonged absorption of the injectable pharmaceutical form can be brought about by the use of agents delaying absorption, for example, aluminum monostearate and gelatin.

5 Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is admixed with at least one inert customary excipient (or carrier) such as sodium citrate or dicalcium phosphate or (a) fillers or extenders, as for example, starches, lactose, sucrose, glucose, mannitol, and silicic acid; (b) binders, as for example, carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidone, sucrose, and acacia; (c) humectants, as for example, glycerol; (d) disintegrating agents, as for example, agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain complex silicates and sodium carbonate; (e) solution retarders, as for example paraffin; (f) absorption accelerators, as for example, quaternary ammonium compounds; (g) wetting agents, as for example, cetyl alcohol and glycerol monostearate; (h) adsorbents, as for example, kaolin and bentonite; and (i) lubricants, as for example, talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, or mixtures thereof. In the case of capsules, tablets, and pills, the dosage forms may also comprise buffering agents.

10

15

20 Solid compositions of a similar type may also be employed as fillers in soft- and hard-filled gelatin capsules using such excipients as lactose or milk sugar, as well as high molecular weight polyethyleneglycols, and the like.

25 Solid dosage forms such as tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells, such as enteric coatings and others well known in the art. They may contain opacifying agents, and can also be of such composition that they release the active compound or compounds in a certain part of the intestinal tract in a delayed manner. Examples of embedding compositions which can be used are polymeric substances and waxes. The active compounds can also be in microencapsulated form, if appropriate, with one or more of the above-mentioned excipients.

30 Liquid dosage forms for oral administration include pharmaceutically acceptable emulsions, solutions, suspensions, syrups, and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in the art, such as water or other solvents, solubilizing agents and emulsifiers,

-14-

as for example, ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propyleneglycol, 1,3-butyleneglycol, dimethylformamide, oils, in particular, cottonseed oil, groundnut oil, corn germ oil, olive oil, castor oil, and sesame oil, glycerol, tetrahydrofurfuryl alcohol, 5 polyethyleneglycols, and fatty acid esters of sorbitan or mixtures of these substances, and the like.

Besides such inert diluents, the composition can also include adjuvants, such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and perfuming agents.

10 Suspensions, in addition to the active compounds, may contain suspending agents, as for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metahydroxide, bentonite, agar-agar and tragacanth, or mixtures of these substances, and the like.

15 Compositions for rectal administrations are preferably suppositories which can be prepared by mixing the compounds of the present invention with suitable nonirritating excipients or carriers such as cocoa butter, polyethyleneglycol or a suppository wax, which are solid at ordinary temperatures but liquid at body temperature and therefore, melt in the rectum or vaginal cavity and release the active component.

20 Dosage forms for topical administration of a compound of this invention include ointments, powders, sprays, and inhalants. The active component is admixed under sterile conditions with a physiologically acceptable carrier and any preservatives, buffers or propellants as may be required. Ophthalmic formulations, eye ointments, powders, and solutions are also contemplated as being within the 25 scope of this invention.

30 In a preferred embodiment of the invention, the labeled compound is introduced into a patient in a detectable quantity and after sufficient time has passed for the compound to become associated with amyloid deposits, the labeled compound is detected noninvasively inside the patient. In another embodiment of the invention, a labeled compound of Formula I is introduced into a patient, sufficient time is allowed for the compound to become associated with amyloid deposits, and then a sample of tissue from the patient is removed and the labeled compound in the tissue is detected apart from the patient. In a third embodiment

-15-

of the invention, a tissue sample is removed from a patient and a labeled compound of Formula I is introduced into the tissue sample. After a sufficient amount of time for the compound to become bound to amyloid deposits, the compound is detected.

5 The administration of the labeled compound to a patient can be by a general or local administration route. For example, the labeled compound may be administered to the patient such that it is delivered throughout the body. Alternatively, the labeled compound can be administered to a specific organ or tissue of interest. For example, it is desirable to locate and quantitate amyloid 10 deposits in the brain in order to diagnose or track the progress of Alzheimer's disease in a patient.

15 The term "tissue" means a part of a patient's body. Examples of tissues include the brain, heart, liver, blood vessels, and arteries. A detectable quantity is a quantity of labeled compound necessary to be detected by the detection method chosen. The amount of a labeled compound to be introduced into a patient in order to provide for detection can readily be determined by those skilled in the art. For example, increasing amounts of the labeled compound can be given to a patient until the compound is detected by the detection method of choice. A label is introduced into the compounds to provide for detection of the compounds.

20 The term "patient" means humans and other animals. Those skilled in the art are also familiar with determining the amount of time sufficient for a compound to become associated with amyloid deposits. The amount of time necessary can easily be determined by introducing a detectable amount of a labeled compound of Formula I into a patient and then detecting the labeled 25 compound at various times after administration. A labeled compound of Formula I is any compound thereof having at least one radioactive element as part of the structure.

30 The term "associated" means a chemical interaction between the labeled compound and the amyloid deposit. Examples of associations include covalent bonds, ionic bonds, hydrophilic-hydrophilic interactions, hydrophobic-hydrophobic interactions, and complexes.

Those skilled in the art are familiar with the various ways to detect labeled compounds. For example, magnetic resonance imaging (MRI), positron emission

-16-

tomography (PET), or single photon emission computed tomography (SPECT) can be used to detect radiolabeled compounds. The label that is introduced into the compound will depend on the detection method desired. For example, if PET is selected as a detection method, the compound must possess a positron-emitting atom, such as ^{11}C or ^{18}F .

Another example of a suitable label in a compound of Formula I is an atom such as ^{13}C , ^{15}N , or ^{19}F which can be detected using magnetic resonance imaging (MRI) which is also sometimes called nuclear magnetic resonance (NMR). In addition, the labeled compounds of Formula I may also be detected by MRI using paramagnetic contrast agents. Compounds having a radioactive element as part of its structure are readily prepared by standard synthetic methods.

Another example of detection is electron paramagnetic resonance (EPR). In this case, EPR probes which are well-known in the art, such as nitroxides, can be used.

The imaging of amyloid deposits can also be carried out quantitatively so that the amount of amyloid deposits can be determined.

The present invention also provides a method of inhibiting the aggregation of amyloid proteins to form amyloid deposits, by administering to a patient in need of inhibition of the aggregation of amyloid protein an amyloid protein inhibiting amount of a compound of Formula I. Those skilled in the art are readily able to determine an amyloid inhibiting amount by simply administering a compound of Formula I to a patient in increasing amounts until the growth of amyloid deposits is decreased or stopped. The rate of growth can be assessed using imaging or by taking a tissue sample from a patient and observing the amyloid deposits therein.

A patient in need of inhibition of the aggregation of amyloid proteins is a patient having a disease or condition in which amyloid proteins aggregate.

Examples of such diseases and conditions include Mediterranean fever, Muckle-Wells syndrome, idiopathic myeloma, amyloid polyneuropathy, amyloid cardiomyopathy, systemic senile amyloidosis, amyloid polyneuropathy, hereditary cerebral hemorrhage with amyloidosis, Alzheimer's disease, Down's syndrome, Scrapie, Creutzfeldt-Jacob disease, Kuru, Gerstmann-Straussler-Scheinker

-17-

syndrome, medullary carcinoma of the thyroid, isolated atrial amyloid, β_2 -microglobulin amyloid in dialysis patients, inclusion body myositis, β_2 -amyloid deposits in muscle wasting disease, sickle cell anemia, Parkinson's disease, and Islets of Langerhans diabetes type 2 insulinoma.

5 Also provided by the present invention are labeled compounds of Formula I, wherein one or more atoms in the compound has been replaced with a radioisotope. The radioisotope can be any radioisotope. However, ^3H , ^{123}I , ^{125}I , ^{131}I , ^{11}C , and ^{18}F are preferred. Those skilled in the art are familiar with the procedure used to introduce a radioisotope into a compound. For example, a
10 compound of Formula I is prepared wherein one carbon atom is ^{11}C or ^{14}C , and is thus a labeled compound.

15 The compounds of the present invention can be administered to a patient at dosage levels in the range of about 0.1 to about 1,000 mg per day. For a normal human adult having a body weight of about 70 kg, a dosage in the range of about 0.01 to about 100 mg per kilogram of body weight per day is sufficient. The specific dosage used, however, can vary. For example, the dosage can depend on a number of factors including the requirements of the patient, the severity of the condition being treated, and the pharmacological activity of the compound being used. The determination of optimum dosages for a particular patient is well-known to those skilled in the art.
20

 The examples presented below are intended to illustrate particular embodiments of the invention and are not intended to limit the scope of the specification, including the claims, in any manner.

EXAMPLES

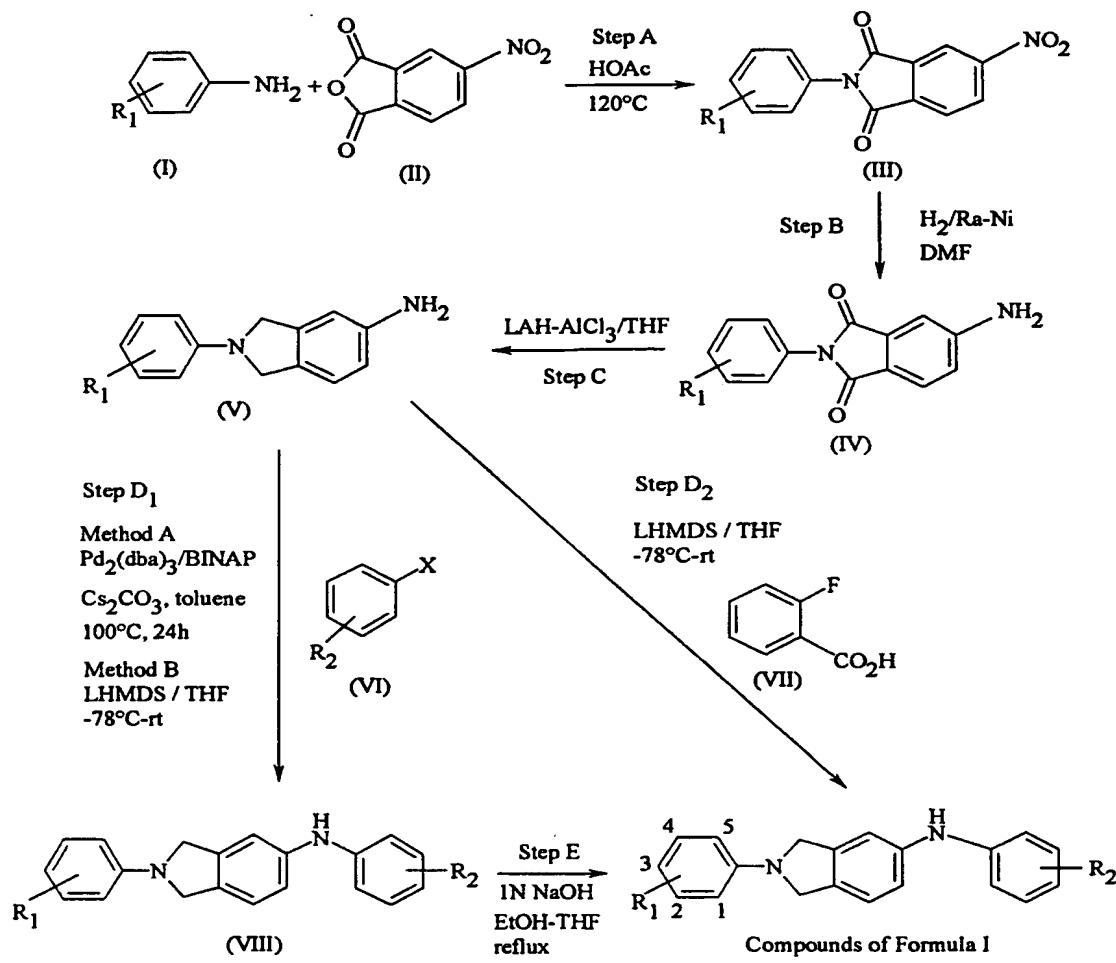

25 Compounds of Formula I can be prepared by the synthetic routes outlined in Scheme 1. An appropriately substituted aniline (I) and 5-nitroisobenzofuran-1,3-dione (II) or similarly substituted furan yields the corresponding phthalimides (III) when heated in acetic acid. Standard hydrogenation conditions, such as Raney-nickel/DMF, of (III) yields the reduced phthalimide (IV). Reduction of

-18-

phthalimide (IV) using standard reducing agents, such as lithium aluminum hydride, gives amine (V). Utilizing Buchwald reaction conditions (J. F. Hartwig, *Angew. Chem. Int. Ed.* 1998;37:2046-2067), (V) can be converted to (VIII) by reacting (V) and various substituted 2-bromobenzoic acid methyl esters (VI) in the presence of cesium carbonate, tris(dibenzylideneacetone)-dipaladium(0), and (S)-(2,2'-bis(di-p-tolylphosphino-1,1'-binaphthyl) (BINAP) (Method A). In addition, (VIII) can also be obtained by reacting (V) with various substituted 2-fluorobenzoic acid methyl esters (VI) in the presence of lithium dimethyl bis(trimethylsilyl)amide (LHMDS) (Method B). Subsequent saponification of (VIII), utilizing standard conditions such as aqueous sodium hydroxide, yields the desired substituted isoindolines of Formula I. In addition, (V) can be converted directly to a compound of Formula I by reacting (V) with 2-fluorobenzoic acid (VII) in the presence of LHMDS.

EXAMPLE 1

Preparation of

2-[2-(2,3,4-Trimethoxy-phenyl)-2,3-dihydro-1H-isoindol-5-ylamino]-benzoic acid

Step A: Preparation of

5-Nitro-2-(2,3,4-trimethoxy-phenyl)isoindole-1,3-dione

A mixture of 2,3,4-trimethoxyphenylamine (91.61 g, 0.50 mol) and 5-nitroisobenzofuran-1,3-dione (96.56 g, 0.5 mol) in acetic acid (1000 mL) was heated to reflux for 2 hours. After cooling, the precipitate was filtered and washed with H₂O (1 L), 1N NaOH (1.5 L), and H₂O (1 L). The resulting precipitate was 10 triturated with boiling MeOH, filtered and dried in vacuum oven (67°C) for 16 hours to give a yellow solid, 144.0 g (0.40 mol, 80%) of the desired product. Melting point (mp) 245-247°C. Analysis for C₁₇H₁₄N₂O₄: Calcd: C, 56.98; H, 3.94; N, 7.82; Found: C, 56.80; H, 4.08; N, 7.80.

Step B: Preparation of

5-Amino-2-(2,3,4-trimethoxy-phenyl)isoindole-1,3-dione

A sample of 5-nitro-2-(2,3,4-trimethoxy-phenyl)isoindole-1,3-dione (89.0 g, 0.25 mol) in THF (1.25 L), MeOH (1.25 L), and DMF (100 mL) was reduced in the presence of Ra-Ni (12 g) at 28°C to 36°C (ΔP = 7.5 psi). The reaction mixture was filtered, and the filtrate was concentrated in vacuum and dried in vacuum 20 oven (67°C) for 16 hours to give an off-white solid, 81.6 g (0.25 mol, 85%) of the desired product. mp >280°C. Analysis for C₁₇H₁₆N₂O₅: Calcd: C, 62.09; H, 4.92; N, 8.52; Found: C, 61.71; H, 4.94; N, 8.48.

Step C: Preparation of

2-(2,3,4-Trimethoxyphenyl)-2,3-dihydro-1H-isoindol-5-ylamine

25 A solution of AlCl₃ (8.12 g, 60.92 mmol) in THF (200 mL) was added slowly to a suspension of LiAlH₄ (1M/THF, 183 mL, 182.75 mmol) in THF (100 mL) at

-21-

-40°C and allowed to stir for 10 minutes. The temperature was raised to 0°C and a suspension of 5-amino-2-(2,3,4-trimethoxyphenyl)-isoindole-1,3-dione (20.0 g, 60.92 mmol) in THF (500 mL) was slowly added portionwise. The reaction mixture was stirred for 3 hours while the temperature was warmed to room 5 temperature (rt). The mixture was cooled back to 0°C and carefully quenched with the addition of 25% NaOH (33 mL) and then H₂O (7.3 mL). This mixture was then stirred at rt for 2 hours, filtered through celite, concentrated, and dried in a vacuum oven (60°C) for 16 hours to give a pale solid, 10.8 g (35.96 mmol, 59%) of the desired product. mp:213-215°C. Analysis for C₁₇H₂₀N₂O₃·0.14 H₂O: 10 Calcd: C, 67.41; H, 6.75; N, 9.25; Found: C, 67.03; H, 6.62; N, 8.98.

Step D₁: Preparation of

2-[2-(2,3,4-Trimethoxyphenyl)-2,3-dihydro-1H-isoindol-5-ylamino]benzoic acid methyl ester

A mixture of 2-(2,3,4-trimethoxy-phenyl)-2,3-dihydro-1H-isoindol-5-ylamine (1.2 g, 4.0 mmol), 2-bromo-benzoic acid methyl ester (0.72 g, 3.3 mmol), cesium 15 carbonate (1.52 g, 4.7 mmol), tris(dibenzylideneacetone-dipaladium(0) (91 mg, 0.1 mmol), and (S)-(2,2'-bis(di-p-tolylphosphino-1,1'-binaphthyl (98%, (S)-tol-BINAP) (102 mg, 0.15 mmol) (L/Pd = 1.5) in anhydrous toluene (30 mL) was heated to 100°C for 24 hours under N₂. After cooling, the reaction mixture was 20 diluted with ether, filtered through celite, and rinsed thoroughly with ether. The filtrate was evaporated to dryness to give a brown residue. Purification by flash chromatography (silica gel, 10% EtOAc/Hexane) yielded 1.39 g (3.2 mmol, 80%) of the desired product. mp 128-129°C. Analysis for C₂₅H₂₆N₂O₅: Calcd: C, 69.11; H, 6.03; N, 6.45; Found: C, 69.39; H, 5.99; N, 6.13.

25

Step E: Preparation of

2-[2-(2,3,4-Trimethoxy-phenyl)-2,3-dihydro-1H-isoindol-5-ylamino]-benzoic acid

A solution of 2-[2-(2,3,4-trimethoxyphenyl)-2,3-dihydro-1H-isoindol-5-ylamino]benzoic acid methyl ester (1.30 g, 2.99 mmol) and 1N NaOH (aq.)

-22-

(20.0 mL) in EtOH (5.0 mL) and THF (20 mL) was heated to reflux for 16 hours. The solvent was removed in vacuum. The residue was diluted with H₂O and acidified with concentrated HCl to pH 1. The resulting precipitate was collected by filtration and triturated with boiling MeOH-H₂O (4:1) and dried in vacuum oven for 16 hours to give Example 1, a brown solid (0.96 g, 2.28 mmol, 76%).
5 mp 194-195°C. Analysis for C₂₄H₂₄N₂O₅: Calcd: C, 68.56; H, 5.75; N, 6.66; Found: C, 68.19; H, 5.57; N, 6.47.

EXAMPLE 2

Preparation of

10 5-Nitro-2-[2-(3,4,5-trimethoxyphenyl)-2,3-dihydro-1H-isoindol-5-ylamino]benzoic acid

A mixture of 2-(2,3,4-trimethoxyphenyl)-2,3-dihydro-1H-isoindol-5-ylamine (1.81 g, 6.03 mmol), 2-bromo-5-nitro-benzoic acid methyl ester (1.49 g, 6.02 mmol), cesium carbonate (2.75 g, 8.44 mmol), tris(dibenzylideneacetone-dipaladium(0) (166 mg, 0.18 mmol) and (S)-(2,2'-bis(di-p-tolylphosphino-1,1'-binaphthyl (98%, (S)-tol-BINAP) (184 g, 0.27 mmol) (L/Pd = 1.5) in anhydrous toluene (30 mL) was heated to 100°C for 48 hours under N₂. After cooling, the reaction mixture was diluted with ether, filtered through celite, and rinsed thoroughly with ether. The filtrate was evaporated to dryness to give a brown residue (6.3 g). The resulted residue was dissolved in EtOH (10 mL) and THF (20 mL), 5N NaOH (aq.) (40 mL) was added, and the mixture was refluxed for 16 hours. The solvent was removed in vacuum. The residue was acidified with concentrated HCl to pH 3. The resulting precipitate was collected by filtration and triturated with boiling MeOH-H₂O (4:1) and dried in a vacuum oven for 16 hours
15 to give Example 2, a yellow solid (1.8 g, 3.87 mmol, 64%). mp >220°C. Analysis for C₂₄H₂₃N₃O₇·0.71 H₂O: Calcd: C, 60.27; H, 5.15; N, 8.79; Found: C, 59.88; H, 4.90; N, 8.42.

Step D₂: Preparation of

10 2-[2-(3-Chloro-phenyl)-2,3-dihydro-1H-isoindol-5-ylamino]-5-nitro-benzoic acid
To the 2-(3-chloro-phenyl)-2,3-dihydro-1H-isoindol-5-ylamine from Example 7, Step C (2 g, 0.008 mol) in THF (100 mL), LHDMS (24.51 mL, 1 M in THF, 24.15 mmol) was added dropwise at -78°C and was allowed to stir for 10 minutes at -78°C. 2-Fluoro-5-nitro-benzoic acid (1.51 g, 0.008 mol) in THF (100 mL)
15 was added dropwise and the solution stirred for 1 hour at -78°C and gradually warmed to room temperature and stirred for 16 hours. The reaction was concentrated and acidified with 3 M HCl (100 mL). The resultant solid was filtered and washed with 10% HCl and then dried under vacuum to yield a brown solid. The product was recrystallized using MeOH and water to give a brown
20 solid, 0.250 g (0.0006 mmol, 7.5%) of the desired product. mp: Color change at 130°C, did not melt >260°C. Analysis of C₂₁H₁₆N₃O₄Cl·0.24 mol H₂O: C, 60.90; H, 4.01; N, 10.15. Found: C, 60.91; H, 4.01; N, 9.75.

15 Invention compounds of Formula I can also be prepared utilizing combinatorial methodology. This procedure permits the rapid synthesis of many analogs embraced by Formula I in small quantities for testing purposes, and then the most potent compounds can be synthesized in large quantities by conventional methods. A typical combinatorial synthetic procedure for compounds of
20 Formula II, for example, is carried out by reacting halo substituted benzoate esters with an amine isoindole to form the corresponding arylamino isoindole, followed by saponification to the carboxylic acid of Formula I (e.g., where y is a benzoic acid moiety). The reactions are carried out on 0.15 mmol scale as follows. Solutions of each halo benzoate reactant (0.18 M) in toluene are placed in 2 dram
25 reaction vials. Each amino isoindole reactant is dissolved in anhydrous toluene to give 0.15 M solutions. A DistriMan pipet is used to add 1 mL (0.15 mmol, 1 eq) of each halo benzoate solution to the appropriate vials containing 1 mL (0.18 mmol, 1.2 eq) of the amino isoindole reactants. A catalyst solution is prepared by

-36-

dissolving 0.025 M of $\text{Pd}_2(\text{dba})_3$ (dipalladium-tridibenzylidene acetone) and 0.075 M of BINAP (2,2'-bis(diphenylphosphino)-1,1'-binaphthyl) in toluene, and 0.25 mL of the catalyst solution is added to each reaction vial. A base, generally cesium carbonate (68 mg, 0.21 mmol, 1.40 eq) is added to each reaction vial, and 5 the vials are capped and placed in a shaker oven and heated at 100°C for 48 hours. The reaction mixtures are then cooled, and the reaction solvents are removed by evaporation. The solid residue is suspended in 400 μL of ethyl acetate and filtered to remove all catalyst. The filtrates are concentrated to dryness by evaporation to provide compounds of Formula I, wherein the benzoic acid portion is esterified 10 (e.g., benzyl or methyl ester). The esters are dissolved in 500 μL of THF/ethanol (1:1 v/v) to which is added 300 μL of 5 M sodium hydroxide. The solutions are shaken for 5 hours at 60°C and then cooled and concentrated to dryness by evaporation of the solvents to provide the desired compounds of Formula I.

AMYLOID ASSAYS

BASSR (Beta-Amyloid Self-Seeding Radioassay)

10 An assay for inhibitors of self-seeded amyloid fibril growth

Materials:

Stock Solutions:

Assay Buffer - 50 mM sodium phosphate, pH 7.5, 100 mM NaCl, 0.02% NaN₃, 1 M urea (filter and store at 4°C)

15 *Soluble A β (1-40) peptide* (Bachem, Torrance, CA) - 2.2 mg/mL in deionized H₂O (stored in aliquots at -20°C, keep on ice when thawed) will self-seed after 1 week storage. Typically, the solution should be stored until no lag phase is seen in the assay.

20 *125I-labeled A β (1-40)* - 150K-350K cpm/ μ L in 100% acetonitrile -0.1% trifluoroacetic acid (TFA) -1% β -mercaptoethanol (aliquots stored at -20°C). *125I-labeled A β (1-40)* can be made in accordance with the procedure set forth by H. LeVine, III in *Neurobiol. Aging*, **16**:755 (1995), which is hereby incorporated by reference, or this reagent may be purchased from Amersham, Arlington Heights, Illinois.

25 *Final assay conditions:* 30 μ M soluble A β (1-40) in deionized water in assay buffer + 20-50K cpm *125I-labeled A β (1-40)* per assay. Compound to be tested is

-41-

dissolved in dimethylsulfoxide (DMSO), typically 5-50 mM stock, such that the final concentration of DMSO is <1% v/v in the assay.

Assay: Reaction mixture for 50 assays (on ice) is comprised of 0.1-0.2 μ L of 125 I-labeled $A\beta$ (125 I-labeled $A\beta$ (1-40)) + 1 μ L of soluble $A\beta$ (1-40) + 13.5 μ L assay buffer per assay. The following are the amounts of the components of the reaction mixture sufficient for 50 assay wells.

5 5-10 μ L 125 I-labeled $A\beta$ (1-40) dried down
 675 μ L assay buffer
 50 μ L soluble $A\beta$ (1-40)

10 **Assay Method**

- 1) Prepare reaction mixture above by mixing components and storing on ice.
- 2) Pipet 14.5 μ L of reaction mixture into each of 50 wells on a polypropylene U-bottom 96-well microtiter plate on ice (Costar 3794).
- 3) Add 1.7 μ L of diluted compound to be tested to each well in a column of eight, including solvent control. Serial 3-fold dilutions from 1 mM (100 μ M final) in assay buffer -urea = 7 dilutions + zero. Each 96-well plate can therefore accommodate 11 samples + 1 Congo Red control (0.039-5 μ M final in 2-fold steps).
- 4) Seal the plate with aluminum film (Beckman 538619) and incubate for 20 minutes on ice.
- 5) Raise the temperature to 37°C and incubate for 3 to 5 hours (depending on the lot of the peptide).
- 6) Remove the aluminum film and add 200 μ L/well of ice cold assay buffer with urea, collecting the radiolabeled fibrils by vacuum filtration through 0.2 μ m pore size GVWP filters in 96-well plates (Millipore MAGV N22, Bedford, MA). Determine the radioactivity of the filters using standard methods well-known to those skilled in the art.

BASST (Beta-Amyloid Self-seeding, ThioflavinT)

An assay for inhibitors of self-seeded amyloid fibril growth

METHODS:**Materials**Stock Solutions:

Assay Buffer - 50 mM sodium phosphate, pH 7.5, 100 mM NaCl, 0.02% NaN₃,

5 1 M urea (filter and store at 4°C).

Soluble A β (1-40) - 2.2 mg/mL in deionized H₂O (store in aliquots at -20°C, keep on ice when thawed) will self-seed after 1 week storage. Typically, the solution should be stored until no lag phase is seen in the assay.

10 *Final assay conditions*: 30 μ M soluble *A β (1-40)* in deionized water in assay buffer. Compound to be tested is dissolved in DMSO, typically 5-50 mM stock, such that the final concentration of DMSO is <1% v/v in the assay.

Assay: Reaction mixture for 50 assays (on ice) comprised of 1 μ L of soluble *A β (1-40)* + 13.5 μ L assay buffer per assay. The following are the amounts of the components of the reaction mixture that result in each of the 50 assay wells.

15 50 μ L soluble *A β (1-40)*

675 μ L assay buffer

Assay Method

- 1) Prepare the reaction mix above by mixing the components and storing on ice.
- 2) Pipet 14.5 μ L of reaction mixture into each of 50 wells of a polystyrene U-bottom 96-well microtiter plate (Corning 25881-96) on ice.
- 20 3) Add 1.7 μ L of diluted compound to be tested to each well in a column of eight, including solvent control. Serial 3-fold dilutions from 1 mM (100 μ M final) in assay buffer -urea = 7 dilutions + zero. Each 96-well plate can therefore accommodate 11 samples + 1 Congo Red control (0.039-5 μ M final in 2-fold steps).
- 4) Seal the plate with aluminum film and incubate for 10 minutes on ice.
- 25 5) Raise the temperature to 37°C and incubate for 3 to 5 hours (depends on the lot of the peptide).

-43-

6) Remove the aluminum film and add 250 μ L/well of 5 μ M thioflavin T (ThT) [T-3516, Sigma-Aldrich] in 50 mM glycine-NaOH, pH 8.5. Read fluorescence on a plate reader (ex = 440 nm/20 nm; em = 485 nm/20 nm) within 5 minutes.

BAPA (Beta-Amyloid Peptide Aggregation)

5 This assay is used to provide a measure of inhibition by a compound against the aggregation behavior of the beta amyloid peptide.

10 The purpose of this assay is to provide a higher volume method of assaying the amount of beta amyloid aggregation using an endpoint assay based on filtration. In this assay, hexafluoroisopropanol (HFIP) is used to break down the initial amyloid peptide to a monomer state and use a concentration of 33 μ M which is high enough so that aggregation will occur at pH 6.0 in several hours.

METHODS:

β -Amyloid Peptide Aggregation, pH 6.0 (BAPA)

15 In a 96-well plate (Costar 3794), we add 25 μ L 50 mM Phosphate Buffer, pH 6.0, 10 μ L 0.5 mg/mL A β (1-40) peptide in 20% HFIP + 0.1 μ L/assay radioiodinated 125 I A β (1-40) [125 I A β (1-40)], and 1 μ L of the compound to be tested starting at 50 mM with a concentration of DMSO <1%. Then, we incubate for 2 to 4 hours at room temperature. We stop the reaction with 200 μ L of 50 mM phosphate buffer, pH 6.0, and filter it through a 0.2 μ m 96-well filter plate (Millipore MAGU N22). We wash the filter plate with 100 μ L of the same phosphate buffer. Aggregation was detected on a Microbeta counter after impregnating the filters with Meltilex (1450-441) and is corrected for background.

BATYM ASSAY

METHODS:

25 Required A β (1-42)(California Peptide) was dried from its hexafluoroisopropanol (HFIP) stock solution. The A β (1-42) was dissolved in dimethylsulfoxide (DMSO) and then mixed with phosphate buffered saline (PBS) (pH 7.4). The mixed A β (1-42) solution was filtered through a 0.2 μ M Omnipore membrane syringe filter (Millipore, Bedford, MA). The compound to be tested in

-44-

DMSO (50 times concentrate) was put into each well (0.5 μ L/well) of a 96-well plate. The A β (1-42) solution was added into each well (24.5 μ L/well). The plate was centrifuged at 1,000 g for 5 minutes and incubated at 37°C for 1 day (A β 1-42; final concentration 100 μ M).

5 After incubation Thioflavin T (ThT) (30 μ M) solution in glycine-NaOH buffer (pH 8.5, 50 mM) was added into each well (250 μ L/well), fluorescence was measured (ex. 440/20 nm; em 485/20 nm) using a fluorescence plate reader. The inhibitory activity was calculated as the reduction of fluorescence with the following formula:

10 Inhibition (%) = $\{(F(A\beta)-F(A\beta+compound)\}/\{F(A\beta)-F (solvent+compound)\} \times 100$

The IC₅₀s (concentration of test compound required to cause a 50% inhibition of aggregation) were calculated by a curve fitting program using the following equation. The data were obtained from two different experiments in triplicate.

15 Inhibition (x) = $100-100/\{1 + (x/IC_{50})^n\}$,

x = concentration of tested compound (M),

IC₅₀ = (M),

n = Hill coefficient.

20 Representative compounds of Formula I have exhibited inhibitory activities (IC₅₀) ranging from about 1 μ M to greater than 100 μ M in the foregoing assays. The results of these assays for specific representative compounds of the present invention are shown in Table 1 below.

A letter in parentheses after particular value indicates the lot of the compound tested. For example, 10 (P) indicates that compound tested was from Lot P. If no lot is specified, the lot of the compound was Lot P. P, Q, R, S, and T are different lots of the compound.

5 The invention compounds have also shown good activity in standard in vivo assays commonly used to evaluate agents to treat diseases related to aggregation of amyloid proteins, especially Alzheimer's disease and other amyloidoses. In one assay, amyloid protein is induced into the spleen of mice by subcutaneous injections of silver nitrate, Freund's complete adjuvant, and an 10 intravenous injection of amyloid enhancing factor. Silver nitrate is administered each day through Day 11. Test compounds are administered to the mice daily starting on Day 1 through Day 11. On Day 12, the animals are sacrificed, and the spleens are removed, histologically prepared, stained with Congo red, and the percent area of the spleen occupied by birefringent, Congo red-stained amyloid is 15 quantitated microscopically.

Another in vivo assay in which the invention compounds have been evaluated uses transgenic mice. The mice bear a human β-amyloid precursor

-47-

protein transgene with a prior promoter, as described by Hsiao et al, "Correlative Memory Deficits, A β Elevation, and Amyloid Plaques in Transgenic Mice," *Science* 1996;274:99-102. These transgenic mice develop β -amyloid deposits at about 9 months of age. By 15 months, diffuse and compact senile plaques are abundant, primarily in the neocortex, olfactory bulb, and hippocampus. Invention compounds are administered orally to the mice beginning at the age of 8 months (just prior to the onset of amyloid deposits) and continuing for several months (up to about age 14-18 months). The animals are then sacrificed and the brains are removed. The amount of amyloid in the brain is quantitated both histologically and biochemically.

The above data establishes that representative invention compounds are active in standard assays used to measure inhibition of protein aggregation. The compounds exhibit excellent specificity, for example, as shown in the BASST assay, as well as the BATYM and BAPA assays. The compounds are thus useful to clinically inhibit amyloid protein aggregation and to image amyloid deposits for diagnostic use. The compounds will be used in the form of pharmaceutical formulations, and the following examples illustrate typical compositions.

EXAMPLE 27

Tablet Formulation

| Ingredient | Amount |
|-------------------------|--------|
| Compound of Example 1 | 50 mg |
| Lactose | 80 mg |
| Cornstarch (for mix) | 10 mg |
| Cornstarch (for paste) | 8 mg |
| Magnesium Stearate (1%) | 2 mg |
| | 150 mg |

The compound of Example 1 is mixed with the lactose and cornstarch (for mix) and blended to uniformity to a powder. The cornstarch (for paste) is suspended in 6 mL of water and heated with stirring to form a paste. The paste is added to the mixed powder, and the mixture is granulated. The wet granules are

-48-

passed through a No. 8 hard screen and dried at 50°C. The mixture is lubricated with 1% magnesium stearate and compressed into a tablet. The tablets are administered to a patient at the rate of 1 to 4 each day for prevention of amyloid protein aggregation and treatment of Alzheimer's disease.

5

EXAMPLE 28

Parenteral Solution

In a solution of 700 mL of propylene glycol and 200 mL of water for injection is added 20.0 g of Compound No. 9. The mixture is stirred and the pH is adjusted to 5.5 with hydrochloric acid. The volume is adjusted to 1000 mL with water for injection. The solution is sterilized, filled into 5.0 mL ampoules, each containing 2.0 mL (40 mg of Compound No. 8), and sealed under nitrogen. The solution is administered by injection to a patient suffering from medullary carcinoma of the thyroid and in need of treatment.

15

EXAMPLE 29

Patch Formulation

20

Ten milligrams of 2-{4-[3-(3,4-dichloro-phenyl)propyl]phenylamino} benzoic acid is mixed with 1 mL of propylene glycol and 2 µg of acrylic-based polymer adhesive containing a resinous cross-linking agent. The mixture is applied to an impermeable backing (30 cm²) and applied to the upper back of a patient for sustained release treatment of amyloid polyneuropathy.

The invention and the manner and process of making and using it, are now described in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, to make and use the same. It is to be understood that the foregoing describes preferred embodiments of the present invention and that modifications may be made therein without departing from the spirit or scope of the present invention as set forth in the claims. To particularly point out and distinctly claim the subject matter regarded as invention, the following claims conclude this specification.
